

Fork Positioners

The fork positioner is a hydraulic device that can allow the individual driving to work the forklift without leaving the seat. They are constructed out of top quality materials and are designed to withstand the most challenging procedures and work surroundings. Side shifting models have the extra ability to laterally position the entire load or the arms so as to facilitate much more precise lifting and placement in a faster and much more effective manner.

The unique fork pocket design can enable operators to securely swing the unit's blades without any fear of damaging the positioning cylinders. This could allow the worker the alternative to either execute independent or simultaneous blade movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into blade positioners on available units.
